Configuring The Learning Process

With both the training data defined and model defined, it's time to configure the learning process. This is accomplished with a call to the `compile()` method of the `Sequential` model class. Compilation requires 3 arguments: an optimizer, a loss function, and a list of metrics.

```
In [ ]: #configure the learning process  
model.compile(loss = 'binary_crossentropy',  
              optimizer = "adam",  
              metrics = ["accuracy"])
```
